

14 shells of 1 mm at the real barrel-layer radii, $\rho = 9 \text{ g/cm}^3$, $Z = 8$, $A = 16$ — vacuum in between

solid red = the 14 shells, each scored on its own surface ($r = 4.2\text{--}106.8 \text{ cm}$) · radial budget 12.6 g/cm^2

transverse — μ , $p_T = 3 \text{ GeV}$, $R = 2.63 \text{ m}$

longitudinal — barrel only, $|z| < 194 \text{ cm}$
