

14 shells of 1 mm at the real barrel-layer radii,  $\rho = 9 \text{ g/cm}^3$ ,  $Z = 8$ ,  $A = 16$  — vacuum in between

solid red = the 14 shells, each scored on its own surface ( $r = 4.2\text{--}106.8 \text{ cm}$ ) · radial budget  $12.6 \text{ g/cm}^2$

transverse —  $\mu$ ,  $p_T = 3 \text{ GeV}$ ,  $R = 2.63 \text{ m}$

longitudinal — barrel only,  $|z| < 194 \text{ cm}$
